Art Unit: 2151

DETAILED ACTION

1. This action is in response to communications filed March 3, 2007, and November 29, 2006.

Response to Arguments

- 2. Applicant's arguments filed November 29, 2006, have been fully considered but they are not persuasive. Applicant argued: in order to expedite prosecution, independent Claims 1, 8 and 15 have been rewritten to recite "displaying the object on the screen in a manner such that objects associated with the owner identifier are discriminated from objects associated with other owner identifiers" (Claim 1; emphasis added) and "program code for displaying the owner identifier on the screen by means of superposition at one of starting and finishing points of the obtained object, and other points of the obtained object, such that objects associated with the obtained owner identifier are discriminated from objects associated with other owner identifiers." (Claims 8 and 15; emphasis added). Examiner submits that these claim amendments still fail to distinguish from the teachings of the prior art for reasons indicated in the previous office action.
- 3. Thus, the references supplied by the examiner in the previous office action covers the claimed limitations. Accordingly, the rejections are sustained. Applicant is requested to review the prior art of record for further consideration.

Art Unit: 2151

Claim Rejections - 35 USC § 103

Page 3

4. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

- (a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.
- 5. Claims 1-5, 8, 13, 15, are rejected under 35 U.S.C. 103(a) as being unpatentable over Nakayama et al., (hereinafter Nakayama), U.S. Patent 5,872,924, in view of Noveck et al. (hereinafter Noveck), U.S. patent 6,823,363.
- 6. In considering claim 1, Nakayama teaches a computer system comprising: a plurality of user systems connected to each other, each user system being adapted to display a work area on a display screen, alternatively a plurality of user systems connected to each other through a computer network (Fig. 1), wherein each of the user systems includes: a collaboration work controller having a user management table (142) for registering a node identification code (147) given for each of the user systems and an owner identifier (154), which indicates the creator of objects, related to the node identification code, wherein said user management table comprises node identification codes, owner identifiers, and security levels (168), and an object management table (142) for registering object information related to the node identification code, wherein said object management table comprises node identification codes and object data (178), (col. 7, line 46 through col. 8, line 31, Fig.'s 7 and 8); and, an obtainer for

Art Unit: 2151

obtaining, based on an event entry for an object, the node identification code related to the object by referring to the object management table, obtaining the owner identifier related to the obtained node identification code by referring to the user management table, and displaying the object on the screen in a manner such that objects associated with the owner identifier are discriminated from objects associated with other owner identifiers, (col. 7, lines 27-42).

Although the disclosed system of Nakayama shows substantial features of the claimed invention, it fails to expressly show: the user management table comprising user names.

Nevertheless, Nakayama does teach the user management table comprising user identifications (160), (col. 7, lines 52-64, Fig.'s 7 and 8).

Thus, it would have been apparent to one of ordinary skill in the art to modify the teachings of Nakayama to show the user management table comprising user names instead of user identifications. This would have advantageously made it easier to determine who owns a particular object, (Nakayama, col. 7, lines 52-64, Fig.'s 7 and 8).

Although the modified system of Nakayama shows substantial features of the claimed invention, it further fails to expressly disclose: the object management table comprising graying-out flags.

Nevertheless, graying-out flags were well known in the art at the time of the present invention. In a similar field of endeavor, graying-out flags are used in the teachings of Noveck to: prevent editing a message by graying out an "edit" button, (col. 7, lines 16-21).

Art Unit: 2151

Thus, it would have been obvious to a person of ordinary skill in the art to show Nakayama teaching the object management table comprising graying-out flags. This would have facilitated restricting operation of an object displayed on a shared window in a more versatile manner (Nakayama, col. 1, lines 60-63, Noveck, col. 5, lines 40-55).

- 7. In considering claim 2, Nakayama further teaches the event entry being a drawing operation carried out by the owner of the object, alternatively a selection operation carried out by a user other than the owner of the object, (col. 10, line 54, through col. 11, line 45).
- 8. In considering claim 3, Nakayama teaches the owner identifier being displayed at one of starting and finishing points of the object, and at other points of the object by means of superposition, (col. 7, lines 36-42, Fig. 6).
- 9. In considering claim 4, Nakayama teaches an editor for performing an editing operation including copying, movement, deletion and others for the obtained object, (col. 5, line 50, through col. 6, line 16).
- 10. In considering claim 5, Nakayama teaches registering security level information (148) related to the node identification code, and the editing operation being permitted within a range compliant with the security level information, (col. 7, line 65, through col. 8, line 20).

Art Unit: 2151

11. In considering claims 8 and 15, Nakayama teaches a method and computer readable storage medium recording program codes used for identifying the owner of a collaboration work object, the object having been created based on collaboration work by using a computer system having a plurality of user systems connected to each other, alternatively a plurality of user systems connected to each other through a computer network, comprising the steps of: causing one of the user systems to store object data contained in collaboration work data received from the other user systems in an object management table (142) by relating the data to a node identification code (147) of each of the other user systems, and to display an object thereof on a screen of the user system, wherein said object management table comprises node identification codes and object data (178), (col. 7, line 46 through col. 8, line 31, Fig.'s 7 and 8); obtaining the node identification code by referring to the object management table when the object displayed on the screen is selected, (col. 7, lines 46-64); obtaining an owner identifier (154), which indicates the creator of objects, related to the obtained node identification code by referring to the user management table of the user system, wherein said user management table comprises node identifications codes, owner identifiers, and security levels (168), (col. 7, line 46 through col. 8, line 31, Fig.'s 7 and 8); and displaying the owner identifier on the screen, by means of superposition at one of starting and finishing points of the selected object, and other points of the selected object, such that objects associated with the displayed owner identifier are discriminated from objects associated with other owner identifiers, (col. 7, lines 27-42, Fig. 6).

Art Unit: 2151

Although the disclosed system of Nakayama shows substantial features of the claimed invention, it fails to expressly show: the user management table comprising user names.

Nevertheless, Nakayama does teach the user management table comprising user identifications (160), (col. 7, lines 52-64, Fig.'s 7 and 8).

Thus, it would have been apparent to one of ordinary skill in the art to modify the teachings of Nakayama to show the user management table comprising user names instead of user identifications. This would have advantageously made it easier to determine who owns a particular object, (Nakayama, col. 7, lines 52-64, Fig.'s 7 and 8).

Although the modified system of Nakayama shows substantial features of the claimed invention, it further fails to expressly disclose: the object management table comprising graying-out flags.

Nevertheless, graying-out flags were well known in the art at the time of the present invention. In a similar field of endeavor, graying-out flags are used in the teachings of Noveck to: prevent editing a message by graying out an "edit" button, (col. 7, lines 16-21).

Thus, it would have been obvious to a person of ordinary skill in the ad to show Nakayama teaching the object management table comprising graying-out flags. This would have facilitated restricting operation of an object displayed on a shared window in a more versatile manner (Nakayama, col. 1, lines 60-63, Noveck, col. 5, lines 40-55).

Art Unit: 2151

12. In considering claim 13, Nakayama further teaches transmitting, when any one of the plurality of user systems starts collaboration work, user information containing a node identification code thereof and an owner identifier to the other user systems, (col. 9, line 54, through col. 11, line 18); and causing the other user systems having received the user information to store in each user management table, (col. 7, lines 46-64).

- 13. Claims 6, 14, are rejected under 35 U.S.C. 103(a) as being unpatentable over Nakayama in view of Noveck, and further in view of Itakura, U.S. patent 6,639,608.
- 14. In considering claims 6 and 14, although the disclosed system of Nakayama shows substantial features of the claimed invention, it fails to expressly show: deleting or eliminating the display of the owner identifier according to a timer operation.

Nevertheless, Itakura teaches a system for displaying images received from a network comprising: deleting an image received over the network according to a timer operation, (col. 10, lines 53-67, col. 11, lines 1-5).

Thus given the teachings of Itakura, it would have been apparent to one of ordinary skill in the art to modify the teachings of Nakayama to show deleting or eliminating the display of the owner identifier on the screen of the user system according to a timer operation. This would have made a user effectively aware of who owns the object for a specified period of time, (Nakayama, col. 1, lines 37-63, Itakura, col. 2, lines 54-67, and col. 3, lines 1-15).

Art Unit: 2151

15. Claim 7, is rejected under 35 U.S.C. 103(a) as being unpatentable over Nakayama in view of Noveck, and further in view of Simonoff U.S. patent 6,463,460.

16. In considering claim 7, Nakayama further teaches a session controller for controlling a session for each collaboration work (col. 4, lines 14-27), wherein the session controller includes a management table (142) for registering a user identification code (146) for identifying a user taking part in the session, and a node identification code (147) of the user system used by the user, and the session controller refers to the management table, and transmits data to the other user systems taking part in the session regarding all sessions registering the user identification code contained in data sent from the user, (col. 7, lines 46-64, col. 4, lines 14-27).

Although the disclosed system of Nakayama shows substantial features of the claimed invention, it fails to expressly show: code for identifying the session.

Nevertheless, in a similar field of endeavor, Simonoff teaches an interactive communication system for collaboration between users comprising: inherent use of a code for identifying a collaboration session, (col. 24, line 53, through col. 25 line 2).

Thus given the teachings of Simonoff, it would have been obvious to one of ordinary skill in the art to modify the teachings of Nakayama to show registering a session identification code for identifying a session in the management table. This would have provided an efficient means for allowing users to join a session already in progress, (Simonoff col. 24, line 53, through col. 25 line 2). This also would have

advantageously provided a means for storing a session for later playback and/or critiquing, (Simonoff, col. 25, lines 25-37).

Allowable Subject Matter

17. Claims 10-12, 17, 18, are allowed for reasons indicated in the previous action.

Conclusion

18. **THIS ACTION IS MADE FINAL.** Applicant is reminded of the extension of time policy as set forth in 37 CFR 1.136(a).

A shortened statutory period for reply to this final action is set to expire THREE MONTHS from the mailing date of this action. In the event a first reply is filed within TWO MONTHS of the mailing date of this final action and the advisory action is not mailed until after the end of the THREE-MONTH shortened statutory period, then the shortened statutory period will expire on the date the advisory action is mailed, and any extension fee pursuant to 37 CFR 1.136(a) will be calculated from the mailing date of the advisory action. In no event, however, will the statutory period for reply expire later than SIX MONTHS from the mailing date of this final action.

19. Any inquiry concerning this communication or earlier communications from the examiner should be directed to Hassan Phillips whose telephone number is 571-272-3940. The examiner can normally be reached on Mon-Fri (8am-5pm).
